Financialia

From voice input to a reviewable transaction

Carlos Plasencia

Founder and sole engineer

An independent product under my brand Totora Studio

The goal

Make expense and income tracking easier through voice or text input.

What I built

A bilingual, installable PWA for accounts, transactions, budgets and reports, with offline support. I developed the architecture, frontend, backend and AI integration.

The engineering decision

Claude proposes structured data. The server validates entity references; users can review, edit and confirm the transaction.

The example shown

Proposed expense: S/5.00 PEN. Category: Mercado. Account: Yape.

Stack

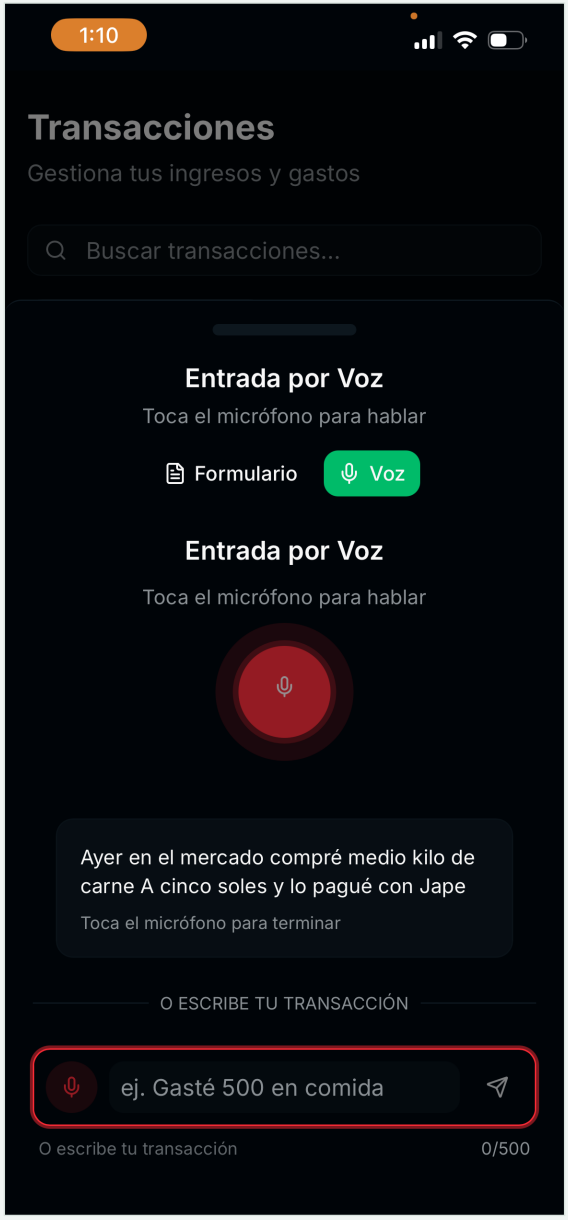

TypeScript, Next.js, NestJS, GraphQL, MongoDB, Redis and Claude API.
